

Roland HP302 (Available in Rosewood or Black)

What are the benefits of the HP302 over the RP201?

- **Improved Piano Sound:** Based on Roland's new SuperNATURAL Piano engine — a breakthrough technology derived from the flagship V-Piano®, as well as 88-key stereo multisampling. SuperNATURAL Piano brings a new level of authentic sound and natural performance to the digital domain. Roland's engineers relentlessly analyzed the complex, ever-changing characteristics of concert grand pianos, faithfully capturing and reproducing the tonal variations based on the velocity of each keystroke. Three key elements have been dramatically enhanced: velocity response, note decay and key-range behavior. The end result is an incredibly expressive and authentic sound that blurs the line between digital and acoustic.
- **Improved Key Touch:** Adds *escapement*...the little click you feel in the key as it's depressed, just as you feel in a grand piano
- **Better Amplification:** Provides better sound
- **Built-In Music Tutor:** No need to rent or purchase the separate Roland Music Tutor...it's built right in to the HP302. The Music Tutor helps students learn faster! You can speed up or slow down CD's, WAV Files, and MIDI files to play along with. Makes learning more musical and you can easily hear and correct mistakes.
- **USB Port for CD-ROM or USB Memory Stick:** Add a CD-ROM drive to play along with your favorite CD's...allows you to transpose, change the speed, and cancel or mute the main instrument or voice of any CD or WAV file. Plug in your USB Memory Stick for recording and playing back MIDI files. Download MIDI files to your USB Memory stick for interactive learning or to play along with.
- **USB-MIDI Port:** Connect directly to a computer using a simple USB printer type of cable (vs buying an external MIDI to USB Interface)
